

Disclaimer

The following report(s) provides findings from an FDA-initiated query using Sentinel. While Sentinel queries may be undertaken to assess potential medical product safety risks, they may also be initiated for various other reasons. Some examples include determining a rate or count of an identified health outcome of interest, examining medical product use, exploring the feasibility of future, more detailed analyses within Sentinel, and seeking to better understand Sentinel capabilities.

Data obtained through Sentinel are intended to complement other types of evidence such as preclinical studies, clinical trials, postmarket studies, and adverse event reports, all of which are used by FDA to inform regulatory decisions regarding medical product safety. The information contained in this report is provided as part of FDA's commitment to place knowledge acquired from Sentinel in the public domain as soon as possible. Any public health actions taken by FDA regarding products involved in Sentinel queries will continue to be communicated through existing channels.

FDA wants to emphasize that the fact that FDA has initiated a query involving a medical product and is reporting findings related to that query does not mean that FDA is suggesting health care practitioners should change their prescribing practices for the medical product or that patients taking the medical product should stop using it. Patients who have questions about the use of an identified medical product should contact their health care practitioners.

The following report contains a description of the request, request specifications, and results from the modular program run(s).

Overview for Request: cder_mpl2p_wp014, Part 1

Request ID: cder_mpl2p_wp014_nsdp_v01

Request Description: In this report we identified individuals with asthma and without chronic obstructive pulmonary disease (COPD) who were dispensed either montelukast or inhaled corticosteroids (ICS) in the Sentinel Distributed Database (SDD), and examined the association between montelukast versus ICS use and suicide. This is report 1 of 2. In report 2, we described rates of mortality among montelukast users and ICS users.

<u>Sentinel Modular Program Tool Used:</u> Cohort Identification and Descriptive Analysis (CIDA) tool, version 7.3.3, with Propensity Score Matched Analysis (PSA) and ad hoc programming.

<u>Data Source:</u> Data between January 1, 2000 and September 30, 2015 from 6 Data Partners contributing to the Sentinel Distributed Database (SDD) with Cause of Death Table data were included in this report. We distributed this request to Data Partners on July 19, 2019. See Appendix A for a list of the dates of available data for each included Data Partner.

<u>Study Design:</u> This study used a retrospective active comparator new user cohort design. We used a CIDA Type 2 with PSA.

<u>Exposures of Interest:</u> The exposure of interest, montelukast, and the comparator of interest, ICS, were defined using National Drug Codes (NDCs). We defined new use as no prior use of montelukast, ICS monotherapy, ICS combination therapies, longacting beta-adrenoceptor agonist (LABAs), or leukotriene receptor antagonists (LTRAs) in the 183 days prior to the first qualifying dispensing (index). For a list of generic and brand drug names used to define the exposure and comparator drugs, please see Appendix B. For a list of codes used to define the washout criteria, please see Appendix C.

Outcome of Interest: The outcome of interest was completed suicide. Please see Appendix D for a list of the International Classification of Diseases, Tenth Revision (ICD-10) codes used to define suicide in this report. We excluded members with evidence of death in the Death Table or Encounter Table any time in the member's history prior to the index date.

Cohort Eligibility Criteria: We required patients to be enrolled in health plans with medical and drug coverage in the 183 days prior to their first qualifying dispensing date (index date), with gaps in coverage of up to 45 days treated as continuous enrollment. We required evidence of an asthma diagnosis and no evidence of chronic obstructive pulmonary disease (COPD) in the 183 days (6 months) prior to the index dispensing. We excluded index episodes with both the exposure and comparator dispensed on the same day. We additionally excluded index episodes with any of the following on the index date: inpatient depressive disorder as the primary diagnosis, outpatient depressive disorder, self-harm hospitalizations¹, or E-codes for self-harm. See Appendix E for a list of codes used to define the inclusion and exclusion criteria in this request. The following age groups were included in the cohort: 6-11, 12-17, and 18+ years.

<u>Follow-up:</u> Exposure episode lengths were defined using days supplied from the outpatient pharmacy dispensing to create a sequence of continuous exposure. Exposure episodes were considered continuous if gaps in days supplied were 15 days or less. Follow-up began on the first day of exposure initiation and continued until the first occurrence of any of the following:

- 1) Dispensing of comparator exposure, combination corticosteroid, LABA, or LTRA; or
- 2) Dispensing of oral corticosteroid; or
- 3) Hospitalization unrelated to self-harm or depression; or
- 4) Non-suicide death; or
- 5) Data Partner end date; or
- 6) Query end date; or
- 7) Disenrollment; or
- 8) Outcome; or
- 9) End of treatment episode.

Please see Appendices F and G for a list of codes and generic and brand drug names defining censoring criteria. Only the first valid exposure episode that occurred during the study period was included per patient.

Overview for Request: cder_mpl2p_wp014, Part 1

Covariates: We assessed the following covariates in the 183 days prior to and including the index date: age, year, sex, Charlson/Elixhauser combined comorbidity score², health service and drug utilization, substance abuse, allergic rhinitis, respiratory disorder (at least 1 code, at least 2 codes, and at least 3 codes), asthma diagnosis (in an emergency care setting, inpatient care setting, and ambulatory/other ambulatory care setting), asthma exacerbations, oral corticosteroid (no use, at least 1 code, at least 2 codes, at least 3 codes), short-acting beta-agonists, anticholinergic agents, phosphodiesterase inhibitors, history of psychiatric disorder (i.e., psychiatric and psychotropic drugs, self-harm, or any other psychiatric events), psychiatric and psychotropic drugs, self-harm, and any other psychiatric event. Please see Appendices H and I for a list of codes and generic and brand drug names defining covariates in this request.

<u>Propensity Score Estimation:</u> We included the following covariates in the propensity score: age, year, sex, Charlson/Elixhauser combined comorbidity score², substance abuse, allergic rhinitis, respiratory disorder use (at least 1 code, at least 2 codes, and at least 3 codes), asthma diagnosis (in an emergency care setting, inpatient care setting, and ambulatory/other ambulatory care setting), asthma exacerbations, oral corticosteroid use, anticholinergic agents, phosphodiesterase inhibitors, and history of psychiatric disorder. The covariates were evaluated in the 183 days prior to and including exposure initiation dispensing date. The Propensity Score Analysis (PSA) tool was used to calculate the propensity scores and identify matched cohorts based on propensity scores within each Data Partner. Please see Appendices H and I for a list of codes and generic and brand drug names defining covariates used in the propensity score estimation in this request.

<u>Matching:</u> We used a 1:1 matching ratio based on propensity score. Individuals in the exposed and comparator cohorts were nearest neighbor matched without replacement using a matching caliper of 0.050.

Analysis: For each comparison, Cox proportional hazards regression models were used to estimate hazard ratios and corresponding 95% confidence intervals for the unmatched analyses, 1:1 conditional matched analyses, and 1:1 unconditional matched analyses. We further analyzed the association between the exposure and outcome by the following subgroups: history of psychiatric disorder (yes vs. no), age group (6-11, 12-17, 18+ years), sex (female vs. male), and labeling year (2000-2007 vs. 2008-2015).

Please see Appendices J, K, and L for the specification of parameters and design diagram used in this request.

<u>Limitations:</u> Algorithms to define exposures, outcomes, inclusion and exclusion criteria, and covariates are imperfect and may be misclassified. Therefore, data should be interpreted with this limitation in mind.

<u>Notes:</u> Please contact the Sentinel Operations Center (info@sentinelsystem.org) for questions and to provide comments/suggestions for future enhancements to this document.

Glossary of Terms for Analyses Using Propensity Score Analysis (PSA) Tool*

Covariate - requester defined binary variable to include in the propensity score estimation model (e.g., diabetes, heart failure, etc.) during requester-defined lookback period. Requester may also choose to add any of the following categorical, continuous, or count metrics to the propensity score estimation model:

- 1. Age (continuous)
- 2. Sex
- 3. Time period (i.e., monitoring period for sequential analyses)
- 4. Year of exposure
- 5. Comorbidity score
- 6. Medical utilization number of inpatient stays
- 7. Medical utilization number of institutional stays
- 8. Medical utilization number of emergency department visits
- 9. Medical utilization number of outpatient visits
- 10. Health care utilization number of other ambulatory encounters (e.g., telemedicine, email consults)
- 11. Drug utilization number of dispensings
- 12. Drug utilization number of unique generics dispensed
- 13. Drug Utilization number of unique drug classes dispensed

Covariate Evaluation Window - specified number of days relative to index date to evaluate the occurrence of covariates of interest. Note: members are required to have continuous enrollment during the covariate evaluation window, regardless of the value included in the "Continuous enrollment before exposure" field.

Individual Level Data Return - program may return individual-level, de-identified datasets to the Sentinel Operations Center (SOC). While the datasets contain a single row per patient for each specified analysis, patient identifiers such as a patient ID are not included in the output. Individual-level datasets are returned to the SOC, aggregated, and used to calculate effect estimates via Cox (proportional hazards) regression.

Mahalanobis Distance - provides a measure of balance across all variables while accounting for their correlation.

Matching Caliper - maximum allowed difference in propensity scores between treatment and control patients. Requester may select any caliper (e.g., 0.01, 0.025, and 0.05).

Matching Ratio - patients in exposed and comparator groups are nearest neighbor matched by a 1:1 or 1:n (up to 10) matching ratio.

Matched Conditional and Unconditional Analysis - in a conditional matched analysis, a Cox model, stratified by Data Partner site and matched set, is run on the matched population. This can be done for both the both 1:1 and 1:n matched cohorts. In an unconditional analysis, a Cox model, stratified by Data Partner site only, is run on the matched population. This can be done for the 1:1 matched cohort only.

Propensity Score Stratification - option to stratify propensity scores based on requester-defined percentiles in the unmatched population. In a stratified analysis, a Cox model, stratified by Data Partner site, is run on the stratified population. Note that all patients identified in exposure and comparator cohorts are used in the analysis.

PSM Tool - performs effect estimation by comparing exposure propensity-score matched parallel new user cohorts. Propensity score estimation and matching are conducted within each Sentinel Data Partner site via distributed programming code; data are returned to the SOC, aggregated, and used to calculate effect estimates.

Risk-set Level Data Return - alternative to the patient-level data return approach. In this approach, the PSM tool will produce deidentified, risk-set level datasets instead of or in addition to individual-level output. Whereas each observation in the patient-level datasets represents one patient in the cohort, each observation in the risk set dataset represents one event. Risk sets are created at the Data Partner site, returned to the SOC, aggregated, and used to calculate effect estimates via case-centered logistic regression.

cder_mpl2p_wp014 Page 5 of 91

Subgroup Analysis - may be conducted using any requester-defined covariates. Subgroup analyses may be performed in the unmatched and the matched population.

Zero Cell Correction - indicator for whether to screen variables with a zero correction added to each cell in the confounder/outcome 2x2 table. Recommended when the number of exposed outcomes is fewer than 150.

*all terms may not be used in this report

Mo	ntelukast
montelukast sodium	Singulair
montelukast sodium	montelukast
Inhaled Corticoste	roids (ICS) Monotherapy
beclomethasone dipropionate	Vanceril
beclomethasone dipropionate	Vanceril Double Strength
beclomethasone dipropionate	Qvar
beclomethasone dipropionate	Beclovent
beclomethasone dipropionate	Beclovent Refill
budesonide	Budesonide
budesonide	Pulmicort Turbuhaler
budesonide	Pulmicort Flexhaler
budesonide	Pulmicort
ciclesonide	Alvesco
flunisolide	Aerospan
flunisolide	Aerobid
fluticasone furoate	Arnuity Ellipta
fluticasone propionate	Flovent
fluticasone propionate	Flovent Rotadisk
fluticasone propionate	Flovent Diskus
fluticasone propionate	Flovent HFA
mometasone furoate	Asmanex Twisthaler
mometasone furoate	Asmanex HFA
triamcinolone acetonide	Azmacort

Appendix C. List of Generic and Brand Drug Names Used to Define Washout Criteria in this Request

Generic Name	Brand Name				
Inhaled Corticosteroid	Inhaled Corticosteroids (ICS) Combination Products				
budesonide/formoterol fumarate	Symbicort				
flunisolide/menthol	Aerobid-M				
fluticasone furoate/vilanterol trifenatate	Breo Ellipta				
fluticasone propionate/salmeterol xinafoate	Advair Diskus				
fluticasone propionate/salmeterol xinafoate	Advair HFA				
mometasone furoate/formoterol fumarate	Dulera				
Long-Acting B	eta Agonists (LABAs)				
arformoterol tartrate	Brovana				
formoterol fumarate	Foradil Aerolizer				
formoterol fumarate	Perforomist				
indacaterol maleate	Arcapta Neohaler				
indacaterol maleate/glycopyrrolate	Utibron Neohaler				
olodaterol HCl	Striverdi Respimat				
salmeterol xinafoate	Serevent				
salmeterol xinafoate	Serevent Refill				
salmeterol xinafoate	Serevent Diskus				
tiotropium bromide/olodaterol HCl	Stiolto Respimat				
Leukotriene Rece	ptor Antagonists (LTRA)				
zafirlukast	Accolate				
zafirlukast	Zafirlukast				
zileuton	Zyflo				
zileuton	Zyflo CR				
zileuton	zileuton

Appendix J. Specifications Defining Parameters Used in this Request

In this report we identified individuals with asthma and without chronic obstructive pulmonary disease (COPD) who were dispensed either montelukast or inhaled corticosteroids (ICS) in the Sentinel Distributed Database (SDD), and examined the association between montelukast versus ICS use and suicide. This request utilized the Cohort Identification and Descriptive Analysis (CIDA) tool, version 7.3.5 with additional programming.

Query Period: January 1, 2000 - September 30, 2015

Coverage Requirement: Medical and Drug Coverage

Pre-index enrollment requirement: 183 days **Post-index enrollment requirement:** None

Restrictions: Male and Female only **Age:** 6-11, 12-17, 18+ years

Enrollment gap: 45 days

Envelope macro: On: Reclassify encounters during inpatient stay as inpatient

Never-exposed cohort: None

Additional Output (Dist of Index, MFU): Censoring

Freeze data: Yes
